Single Use Paper Cups/Containers/Lids
Product Usage Guidelines

Usage of Paper Cups/Containers:

GPI's disposable packaging is intended for single use. Single use cups and containers are designed to contain the fill product for the time it takes to consume the beverage or food under normal conditions. These are general packaging guidelines used in a very wide range of situations.

Temperature & Microwave Requirements for Hot Paper Cups/Containers:

GPI's hot cups and food containers, as well as their respective hot application lids, are designed to contain hot beverages and food products that do not exceed temperatures of 190ºF. They are not designed for reheating or reuse. They are not intended for use as microwave-cooking containers. The product in the cup combined with oven time and temperature, when micro-waved, can in some cases create temperatures that exceed the safe-use range of a paper cup.

Specific Uses:

Since customers have different needs for the use of GPI paper cups/containers, we recommend our cups/food containers and lids be tested by the customer to ensure that our products will be appropriate for their specific use in their operations.

Shelf Life:

GPI recommends a one-year shelf life on paper cups/food containers/lids. Storage and transportation conditions may vary, and can extend or shorten the recommended shelf life. Furthermore, the first in, first out (FIFO) method for managing inventory should be followed.

Standard Recommended Storage Conditions:

Dry, ambient conditions
