

Predictive Maintenance Program

The Predictive Maintenance Program (PMP) is the complete package based upon the concept of performing maintenance procedures and replacing parts systematically before they fail. The program uses historical data, OEM recommendations and GPI's 30+ years of machine construction and service experience to accurately anticipate the useable life of many components and recommend replacement of parts accordingly.

By replacing components near the end of their lifecycle, costly downtime can be averted. Emergency service and expedited parts orders are virtually eliminated.

GPI's Predictive Maintenance Program Features:

- Planned service visits, based on machine and usage
- Service provided by experienced professionals
- Parts and labor included
- Training, set-up and calibration performed with each service
- 100% warranty on parts
- Budgeted cost control and flexible payment options
- Training and coaching from our technicians to the customer's maintenance team

Maintenance Reduces Cost

In today's increasingly competitive and cost-conscious environment, production facilities are continuously looking for ways to reduce costs while improving the efficiency and reliability of their processes.

Ineffective maintenance management costs U.S. industry an estimated \$60 billion yearly. Graphic Packaging's PMP solution makes it easy to avoid machine downtime and increase performance, while reducing cost.

Why Use PMP?

GPI's Predictive Maintenance Program is ideal for taking on your maintenance requirements. By using experienced machinery professionals to work on-site with your plant service personnel, the necessary maintenance tasks are performed. Program visits are also used as an opportunity to transfer the knowledge and expertise of our technicians through training and coaching. Before we leave your plant, we ensure your machine is set-up and calibrated to factory specifications.

- Provides increased operational life of components and machine availability
- Less down time and greater scheduling control
- Allows for preemptive corrective actions
- Greater cost control and improved machine performance
- Experienced technicians dedicated to your machine
- Training and certification available for your staff
- Enhanced performance, efficiency and reliability through legacy program and machine
